STOCK ICON-AC

ALARM CHALLENGE MODULE

The STOCK™ Alarm Challenge module is available with the STOCK ICON SCADA control system. Designed specifically to test and document all alarms, devices, logic, and critical control factors.

With a ballast load in the retort, the ICON Alarm Challenge software module executes a series of checks in order to test, verify, and validate all alarms, devices, logic, and critical control factors. These checks are executed and documented across every phase of the process, and once the Alarm Challenge process is complete, a report is provided documenting the results of module execution.

Reports and documentation provided by the Alarm Challenge module can be used in conjunction with other validation protocol, maintenance records, and your own SOP's, which can all be a part of your requisite record keeping needs.

FEATURES AND BENEFITS

- Quickly and automatically ensures retort alarms, devices, logic and critical control factors are functioning properly
- Reports and documentation offer additional support for requisite record keeping needs
- Seamlessly integrates into the ICON SMS SCADA control system
